

True Northwest, Inc.
Scientists You Can Talk To

Grow Check

Our **Grow Check** service assists producers in quantifying the various cannabinoid levels at all stages of growth. Knowledge of when THC and/or CBD are at their peak helps to determine the best harvest dates for your crop.

Here's how it works:

True Northwest will perform three weeks of potency analysis during the flowering cycle of your grow. The data will be reviewed and organized in a way that aids your company's critical decision making. You'll have the opportunity to speak with our analysts and lab director to gain more insight on what your data means.

What we need from you:

Submit 3 flower samples each week, 9 total. The samples should be harvested and submitted every 2-3 days. It's important that each sample is processed in the same way. Use a project tracking sheet to record data: Start of Flowering Cycle, Harvest Date, and more.

Completed Project Outcome:

Clients will receive a comprehensive report that includes raw data, weekly averages, and standard deviations. The project report will quantify all 3 weeks of data and provide visual representations to create an easy to read final product. True Northwest's lab team will be available to elaborate on any areas of the project.
